

Evans 讲义: 最大化

最优控制理论: 研究受控的动力系统

$$\begin{aligned} x(t) &\in \mathbb{R}^n \\ \alpha(t) &\in A \subset \mathbb{R}^m \end{aligned} \quad \left. \begin{aligned} \dot{x}(t) &= f(x(t), \alpha(t)) \\ x(0) &= x_0 \end{aligned} \right\} \quad \begin{array}{l} t > 0 \\ \text{状态} \quad \text{控制} \end{array}$$

目标: 寻找最优控制 $\alpha^*(t)$, 使得收益泛函 最大化

$$J[\alpha(\cdot)] := \int_0^T r(x(t), \alpha(t)) dt + g(x(T))$$

运行收益 $\rightarrow$ $r(x(t), \alpha(t))$ 终端收益 $\rightarrow$ $g(x(T))$

第二章:

$$\begin{aligned} M &\in \mathbb{R}^{n \times n} \\ N &\in \mathbb{R}^{n \times m} \end{aligned}$$

线性系统: $\dot{x}(t) = Mx(t) + N\alpha(t)$ 控制集: $A = [E, I]^m$
 $x(0) = x_0$

① 基本解: $\dot{x}(t) = Mx(t) \Rightarrow x(t) = \exp(tM)x(0)$
 若 $x(0) = I \Rightarrow x(t) = \exp(tM)$

② 唯一解: $\dot{x}(t) = Mx(t) + N\alpha(t)$
 $\Rightarrow x(t) = \exp(tM)x_0 + \int_0^t \exp((t-s)M)N\alpha(s) ds$

③ 可控性 $C(t) := \{x_0 \mid \text{能在 } t \text{ 时间内被控制到原点 } 0\}$
 $C = \bigcup_{t>0} C(t) \leftarrow$ 点可达集

假设

可达集结构: C 是对称且凸的

代数可控性条件: $G = [N, MN, M^2N, \dots, M^{n-1}N]$
 $\text{rank}(G) = n$

定理: 系统可控 ($C = \mathbb{R}^n$) $\Leftrightarrow \text{rank}(G) = n$, 且 M 满足 $\text{Re}(\lambda) \leq 0$

④ 可观则性 带观测量的系统 $\left\{ \begin{aligned} \dot{x}(t) &= Mx(t) \\ y(t) &= Nx(t) \end{aligned} \right.$ $\leftarrow$ 状态 $\rightarrow$ 观测

对偶定理: $\left\{ \begin{aligned} \dot{x} &= Mx \\ y &= Nx \end{aligned} \right.$ 可观 $\Leftrightarrow \left\{ \begin{aligned} \dot{z} &= M^T z + N^T \alpha \end{aligned} \right.$ 可控

假设

⑤ Bang-Bang 原理

Bang-Bang 控制: $\alpha \in [-1, 1]^m$ 但 α 取极值 (± 1)

定理: 若存在 α 将 x_0 导向 0, 则 α 一定是 Bang-Bang

第三章 线性时间最优控制

$$\begin{cases} \dot{x}(t) = Mx(t) + N\alpha(t) & t > 0 \\ x(0) = x_0 \\ \alpha(t) \in [-1, 1]^m \end{cases}$$

收益: $P[\alpha(t)] = -\tau$

存在最优控制 $\Leftrightarrow$ 存在 α 使得存在 t 解 $x(t) = 0$

$$① x_0 = -\int_0^{\infty} X^T(s) N \alpha(s) ds$$

$K(t, x_0) := \{x_1 \mid \text{从 } x_0 \text{ 出发, } t \text{ 时间后可达的点}\}$

② Pontryagin 极大值原理

最优控制满足 $h^T X^T(t) N \alpha^*(t) = \max_{a \in A} \{h^T X^T(t) N a\}$

Hamiltonian: $H(x, p, a) = \dot{x} \cdot p \leftarrow \text{协态变量}$
 $= (Mx + Na) \cdot p$

③ PMP 三件套

$$① \dot{x}^*(t) = \nabla_p H(x, p, a) = Mx^*(t) + Na^*(t) \quad (\text{ODE})$$

$$② \dot{p}^*(t) = -\nabla_x H(x, p, a) = -M^T p^*(t) \quad (\text{ADJ})$$

$$③ H(x^*(t), p^*(t), a^*(t)) = \max_{a \in A} H(x^*(t), p^*(t), a) \quad (\text{PMP})$$

$$\Rightarrow p^*(t)^T N \alpha^*(t) = \max_{a \in A} \{p^*(t)^T N a\}$$

$$\text{开关函数 } \phi(t) = N^T p^*(t) \Rightarrow \alpha^*(t) = \text{sign}(\phi(t))$$

第四章 PMP

① 变分法基本问题

$$I[x(\cdot)] := \int_0^T L(x(t), \dot{x}(t)) dt$$

$v(t)$ $\swarrow$ 最小化
 $\nwarrow$ Lagrangian 量

② Euler-Lagrange 方程

若 $x^*(\cdot)$ 是上述问题的解, 则

$$\frac{d}{dt} [\nabla_{\dot{x}} L(x^*(t), \dot{x}^*(t))] = \nabla_x L(x^*(t), \dot{x}^*(t))$$

引入 Hamiltonian: $H(x, p) := p \cdot v(x, p) - L(x, v(x, p))$

Euler-Lagrange 方程等价于:

$$\begin{cases} \dot{x}(t) = \nabla_p H(x(t), p(t)) \\ \dot{p}(t) = -\nabla_x H(x(t), p(t)) \end{cases}$$

③ PMP (两个版本)

Hamiltonian: $H(x, p) = f(x, a) \cdot p + r(x, a)$

$\dot{x} = f(x, a)$ $\nwarrow$ 最大化收益 $P[a(\cdot)]$

$$\begin{cases} \dot{x}(t) = f(x(t), a(t)), & t > 0 \\ x(0) = x_0 \end{cases}$$

时间固定, 终端自由

收益: $P[a(\cdot)] = \int_0^T r(x, a) dt + g(x(T)).$

(ODE) ...

(ADJ) ...

(PMP) ...

横截性条件 $p^*(T) = \nabla_x g(x^*(T)).$

收益: $P[\alpha(\cdot)] = \int_0^T r(x(\tau), \alpha(\tau)) d\tau$

(ADT)

$$H(x^*(t), p^*(t), \alpha^*(t)) \equiv 0 \quad \forall t \in [0, z^*]$$

→ t : 开始时间

$$| \chi(\tau) = \chi$$

价值函数 $v(x, t) := \sup_{a \in A} P_{x, t}[a(\cdot)]$

边界条件: $v(x, T) = p(x)$

$$v_t(x, t) + \max_{a \in A} \{ f(x, a) \cdot \nabla_x v(x, a) + r(x, a) \} = 0 \quad \forall t \in [0, T]$$

$$u(x, T) = g(x)$$

3) λ Hamiltonian: $H(x, p) = \max_{a \in A} \{ f(x, a) p + r(x, a) \}$

$$\Rightarrow V_e(x, t) + H(x, t), \nabla_x V(x, t) = 0.$$

③ 两步法求最优控制

① 解 HJB, 得到 $v(x, t)$

② 利用 $v(x, t)$ 构造 $\alpha^*(x, t)$.

最优性验证定理

上述两步法得到 α^* 满足

$$P_{x,t}[\alpha^*(\cdot)] = v(x,t) = \sup_{a \in A} P_{x,t}[a]$$

第六章: 微分博弈

$$\begin{cases} \dot{x}(s) = f(x(s), \alpha(s), \beta(s)) & s \in [t, T] \\ x(t) = x. \end{cases}$$

$$\text{收益: } P_{x,t}[\alpha(\cdot), \beta(\cdot)] = \int_t^T r(x(s), \alpha(s), \beta(s)) ds + g(x(T)).$$

① 两人零和博弈问题

Player I: 最大化 $P_{x,t}$ Player II: 最小化 $P_{x,t}$

假设: 非预期策略

Defn: 下值函数: Player II 占优, 对 Maximizer 不利.

$$v(x,t) = \inf_{\beta \in B(t)} \sup_{\alpha \in A(t)} P_{x,t}[\alpha(\cdot), \beta(\cdot)]$$

策略 $\xrightarrow{\quad}$ $\xleftarrow{\quad}$ 控制 $\xleftarrow{\quad}$ Player II 基于 α 的策略

Defn: 上值函数: Player I 占优, 对 Minimizer 不利.

$$u(x,t) = \sup_{\alpha \in A(t)} \inf_{\beta \in B(t)} P_{x,t}[\alpha(\cdot), \beta(\cdot)]$$

策略 $\xrightarrow{\quad}$ $\xleftarrow{\quad}$ 控制 $\xleftarrow{\quad}$ Player I 基于 β 的策略

一般, 有 $v(x,t) \leq u(x,t)$. 当 $v(x,t) = u(x,t)$, 则称博弈有值

② Isaacs 方程

$$\text{下值: } \begin{cases} v_t + \max_{a \in A} \min_{b \in B} \{ f(x, a, b) \cdot \nabla_x v(x,t) + r(x, a, b) \} = 0 \\ v(x, T) = g(x) \end{cases}$$

$$\text{上值: } \begin{cases} u_t + \min_{b \in B} \max_{a \in A} \{ f(x, a, b) \cdot \nabla_x u(x, t) + r(x, a, b) \} = 0 \\ u(x, T) = g(x) \end{cases}$$

③ Minimax 条件 (Isaacs 条件)

$$\text{如果: } \max_{a \in A} \min_{b \in B} \{ f \cdot p + r \} = \min_{b \in B} \max_{a \in A} \{ f \cdot p + r \}$$

$$\text{有: } v(x, t) = u(x, t)$$

④ 鞍点条件

$$P_{x,t} [\alpha(\cdot), \beta^*(\cdot)] \leq P_{x,t} [\alpha^*(\cdot), \beta^*(\cdot)] \leq P_{x,t} [\alpha^*(\cdot), \beta(\cdot)]$$

⑤ PMP

$$\dot{x}^*(t) = \nabla_p H(x^*(t), p^*(t), \alpha^*(t), \beta^*(t))$$

$$\dot{p}^*(t) = -\nabla_x H(x^*(t), p^*(t), \alpha^*(t), \beta^*(t))$$

$$H(x^*, p^*, \alpha, \beta^*) \leq H(x^*, p^*, \alpha^*, \beta^*) \leq H(x^*, p^*, \alpha^*, \beta)$$

$$\rightarrow \begin{cases} H(x^*, p^*, \alpha^*, \beta^*) = \max_{a \in A} H(x^*, p^*, a, \beta^*) \\ H(x^*, p^*, \alpha^*, \beta^*) = \min_{b \in B} H(x^*, p^*, \alpha^*, b) \end{cases}$$

$$\text{终端条件: } p^*(T) = \nabla_x g(x^*(T))$$
